Experiment 2 Instructions

Welcome to the experiment! We are going to play a card game for 8 rounds. You will make the decision of how many hours you will work in various scenarios.

In each round I will give you a card. Your wage that round is the card number multiplied by 2 (Ace = 1, Jack = 11, Queen = 12, King = 13). Sometimes you will keep the same card for two rounds in a row; I will tell you when.

You must *decide how many hours you want to work that week.*

Twelve hours of each day are already accounted for: 8 hours of sleep and 4 hours for eating, washing and getting around. That leaves you 12 hours a day (84 hours a week), to divide between work and everything else (seeing friends, exercise, hobbies, reading, doing nothing). Every hour you work is an hour you don't spend on those things.

Example: Your card is a 4, so your wage is 8 euro per hour. If you choose to work 23 hours, your income is 23 x 8 = 184 euros for the week. The number 23 is only an example, and it is not a suggestion.

There is no correct answer in this experiment and you are not graded on the number you choose. Answer this as if this was your actual weekly situation.

There are 8 rounds in total. The situation will change between each round. I will announce the changes before the round begins, and you will fill in the columns yourself.

Some additional rules:
You can only use whole hours (4, 5, 6, etc.), zero is allowed!
Decide on your own! We will discuss after.
Do not go back and change your previous answers in earlier rounds.

Please write your name, student ID:

Name: _____ Student ID: _____

Please fill in the table below as we go along:

Round	**Card #**	**Wage**	**Hours Available**	**Take-home wage**	***Hours Worked***	**Take-home Income**
1						
2						
3						
4						
5						
6						
7						
8						

Take-home wage is the same as your wage unless I tell you otherwise.
