Instructions

Welcome to the experiment! We are going to play a card game. I will now give each of you a pair of playing cards, one red card (Hearts or Diamonds) and one black card (Clubs or Spades). The numbers or faces on the cards will only matter for matching purposes. You will be asked to play one (or both) of these cards by holding them to your chest. After which, you will be randomly matched with someone in your row. Your earnings are determined by the card that you play and by the card played by the person matched with you.

There are two possible roles you can play in this game: Proposer or Responder. Your roles will be randomly determined at the beginning of each round by a coin toss. If the coin is heads, odd-numbered cards will be proposers; if tails, even-numbered cards will be proposers. In each round, proposers will begin with an endowment of $100 (hypothetical, more info below).

Proposers must choose how much of their endowment to give to their prospective responder from the following available options:
- Red card: Keep $100, and give $0 to the responder.
- Black card: Keep $80, and give $20 to the responder.
- Red + Black: Keep $50, and give $50 to the responder.

These available options remain the same throughout all rounds. After proposers make their choice responders make their decision.

Responders must decide whether to accept or reject the proposer's offer. A *red card indicates rejection*, and a *Black card indicates acceptance*. If the offer is accepted, the payoffs are distributed according to the proposal. If it is rejected, both players receive 0.

You will be matched with the same partner for all 10 rounds. The first five rounds will proceed as described above. After the 5th round, I will modify the structure of the game.

There will be two winners of 1 extra credit point. After the final round, I will total everyone's earnings. You will be grouped into EVEN and ODD card groups. For each group, I will rank the earners from highest to lowest. From this list, I will select the top five earners (numbered 1 to 5) and enter them into a lottery. I will then generate a random number from 1 to 5 for each lottery, and the fifth number drawn will determine the winner. The winner in each lottery group will earn one extra credit point.

Name: _____ Student ID: _____ Card: _____

Partner's name: _____

Please fill in your information above and the table below as we go along:

round	role	proposer card (R/B/RB)	responder card (R/B/RB)	your earnings
